Abstract for an Invited Paper
for the NWS16 Meeting of
the American Physical Society

Neutrino nus

HEIDI SCHELLMAN, Oregon State University, MINERVA COLLABORATION

Neutrinos are almost massless chargeless particles that only feel the weak interaction. They are hard to make (unless you have a nuclear reactor or particle accelerator lying around) and even harder to detect. Despite these obstacles, a whole new field of neutrino studies has opened up since the definite observation of neutrino oscillations in the late 90s. I will review a small fraction of the exciting recent results in neutrino physics and outline some of our plans for the future.
