The American Physical Society

Measurement of Neutron Knockout Cross Section of 24O to the Groud-State of 23O[1] DILUPAMA DIVARATNE, CARL BRUNE, PAUL KING, HARSHA ATTANAYAKE, STEVE GRIMES, INPP, Ohio University, MICHAEL THOENNESSEN, NSCL, Michigan State University, NSCL/MONA COLLABORATION — This research provides an understanding of the structure of the ground state wave-function of ^{24}O through measuring the neutron knockout cross section of ^{24}O to the $\frac{1}{2}^+$ ground state of ^{23}O. The experiment was conducted at the National Superconducting Cyclotron Laboratory using the S800 spectrograph and 470 mg/cm^2 Be reaction target with 92.3 MeV/u ^{24}O beam energy. The cross section values to the different final states of ^{23}O along with the related spectroscopic factors will convey to us information regarding how doubly magic ^{24}O is. Specific details of this investigation, analysis, and interpretation of resulting cross sections will be discussed.

[1]Funded in part by the U.S. DOE, under grant no. DE-FG02-88ER40387.
