Abstract for an Invited Paper
for the SES13 Meeting of
the American Physical Society

Recent Results from the CMS Experiment

DARIN ACOSTA, University of Florida

The CMS experiment has recorded 25 inverse femtobarns of integrated luminosity in the first three years of operation of the LHC at proton-proton center-of-mass energies of 7 and 8 TeV, providing a rich dataset for precision measurements and new particle searches at the high energy frontier. The latest measurements of the properties of the newly observed boson at a mass of 125 GeV will be reported, as well as searches for the Higgs boson in additional decay channels. This report also will cover searches for evidence of Supersymmetry and other exotic phenomena using the full dataset. Finally, recent precision Standard Model measurements and searches for rare decay processes such as $B^0 \rightarrow \mu^+ \mu^-$ will be reported.
