

Abstract Submitted
for the TSF14 Meeting of
The American Physical Society

Comparison of CME and CIR driven storms based on observations made by TWINS BIANCA TRIGO, GUNNER ROBISON, Texas Lutheran University, AMY KEESEE, West Virginia University, JERRY CARR JR., Texas Lutheran University — The analysis of data collected from the TWINS missions for an intense CME driven storm on September 26 2011 and a CIR driven storm on October 13 2012 will be presented. Geomagnetic storms are categorized into two different groups' Coronal mass ejection, CME, and corotating interaction regions, CIR, driven storms. For CME driven storms, there are intense and moderate storms based on their magnetic intensity, moderate is $-78D_{st}$ anything below is categorized as an intense CME storm driver.
