Optical Storage of a dielectric ternary crystal doped with Europium

RICARDO RODRIGUEZ-MIJANGOS, Universidad de Sonora, RAUL PÉREZ-SALAS, Universidad de Sonora, GUSTAVO VAZQUEZ-POLO, Universidad Nacional Autónoma de México — In this work we study the thermoluminescent properties of KCl(0.5):KBr(0.25)RbBr(0.25) with 0.01% of Europium under “beta” radiation exposure. The glow curve shows lights emission for two temperature region. Around 140 and 332 Celsius degrees, which increases with the time of exposure in both regions. Light emission of the second region increases linearly with the time. In each region there is a very small fading, showing that this crystal has high capacity to store optical energy as well as a possible dosimetry application.
