Nuclear quantum effects in water\textsuperscript{1} JOSEPH MORRON, ROBERTO CAR, Dept. of Chemistry, Princeton University — In this work, a path integral Car-Parrinello molecular dynamics\textsuperscript{2} simulation of liquid water is performed. It is found that the inclusion of nuclear quantum effects systematically improves the agreement of first-principles simulations of liquid water with experiment. In addition, the proton momentum distribution is computed utilizing a recently developed “open” path integral molecular dynamics methodology\textsuperscript{3}. It is shown that these results, which are consistent with our computations of the liquid structure, are in good agreement with neutron Compton scattering data\textsuperscript{4}. The remaining discrepancies between experiment and the present results are indicative of some degree of over-binding in the hydrogen bond network, likely engendered by the use of semi-local approximations to density functional theory in order to describe the electronic structure.
