Boron Fullerenes: An Electronic Structure Study

ARTA SADRZADEH, OLGA PUPYSHEVA, Rice University, IHSAN BOUSTANI, Berg Univ Gesamthshch Wuppertal, BORIS YAKOBSON, Rice University, BORIS I. YAKOBSON TEAM, IHSAN BOUSTANI COLLABORATION — Using *ab initio* calculations, we study electronic structure and frequency modes of B$_{80}$, a member of boron fullerene family made from boron isomorphs of carbon fullerenes with additional atoms in the centers of hexagons. We also investigate geometrical and electronic structural properties of double-rings with various diameters, which are important as building blocks of boron nanotubes, and as the most stable clusters among the studied isomers with no more than 36 atoms. Double-rings also appear as building blocks of B$_{80}$. Furthermore, we investigate the possibility of further stabilizing some of fullerenes by depleting them.
